2. (Amended) A manufacturing method for an organic electro-luminescent device, comprising:

forming light emitting layers by discharging, above a substrate, at least two compositions, each including at least one organic electro-luminescent material; and

when discharging compositions which has a same number of organic electro-luminescent materials, ordering discharging said compositions above the substrate starting with a composition which is most difficult to be phase separated after the layer is formed.

3. (Twice Amended) The manufacturing method for an organic electro-luminescent device according to claim 1, further including the step of, during two continuous cycles of discharging said compositions, performing the subsequent discharging of a composition after the composition discharged in a first cycle are dried.

4. (Amended) The manufacturing method for an organic electro-luminescent device according to claim 3, further including the steps of, prior to said step for forming a light emitting layer, forming pixel electrodes corresponding to a plurality of pixel regions and banks separating said pixel regions above said substrate; forming a hole injection/transport layer above said pixel electrodes of said plurality of pixel regions; and after said process for forming a light emitting layer, forming a counter electrode above said light emitting layer.

5. (Twice Amended) An organic electro-luminescent device manufactured by the manufacturing method according to claim 1.

6. (Amended) An electronic equipment, comprising:

the organic electro-luminescent device according to claim 5.

7. (Amended) The manufacturing method for an organic electro-luminescent device according to claim 2, further including the step of, during two continuous cycles of discharging said compositions, performing the subsequent discharging of a composition after the composition discharged in a first cycle are dried.
